**Bay Area Lyme**  
FOUNDATION

- DOWN**
- The most common Lyme disease host here in CA.
  - Under a microscope, the bacteria looks like little spiral-shaped worms called \_\_\_\_\_.
  - When you brush against these plants along a trail, ticks can jump on to you as you pass by.
  - A young, fully formed tick is called a \_\_\_\_\_.
  - The most common treatment for Lyme disease is this type of medicine.
  - Lyme disease is not a virus. It is a \_\_\_\_\_ infection.

- ACROSS**
- The bacteria that causes Lyme disease lives in this part of the tick's body.
  - Another place that ticks like to hang out. These types of plants grow alongside trails and provide an additional tick habitat.
  - Ticks like to live in piles of \_\_\_\_\_ that gather under trees in the fall.
  - The infection replicates in this part of a human's body, eventually migrating to all parts of the body, including the brain.
  - Animals that ticks feed off of: Lyme disease spreads when the \_\_\_\_\_ is infected with Lyme disease.
  - When the tick is attached and feeding, the bacteria migrates into the tick's \_\_\_\_\_.
  - Ticks lay these to perpetuate their species.
  - The tick's mouth parts that pierce the skin to enable the tick to feed.
  - Ticks grow in stages; each stage has a specific name. This is the grub stage.
  - This CAN be an early symptom of Lyme's, but not everyone develops this reaction to a tick bite.
